

Agricultural Products

Results of the Environmental KAP Survey

95 %

believe that Armenian products, including fruits, vegetables, meat, cheese, milk, yogurt, and herbs are more natural and contain fewer chemicals than imported products.

However, this conviction does not necessarily result from their own production experience. According to the experts in the field, there is no testing on pesticide or antibiotic residues in products, and certification is not yet widespread.

Alarming Facts

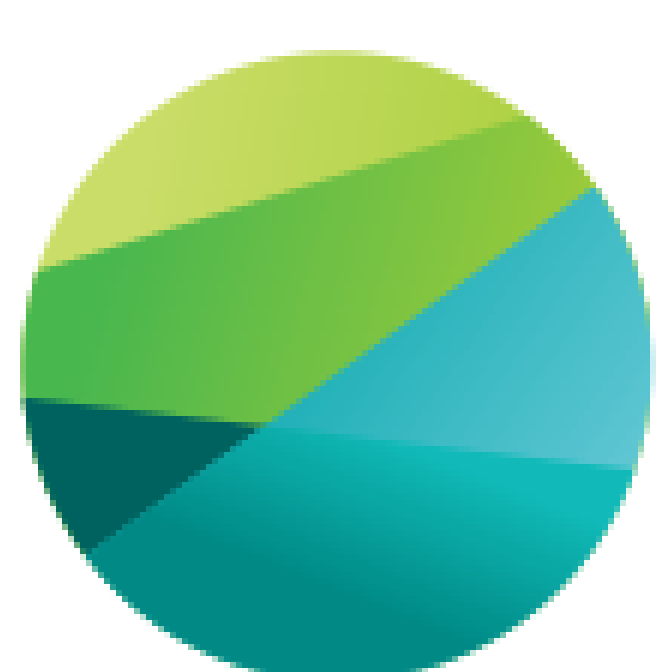

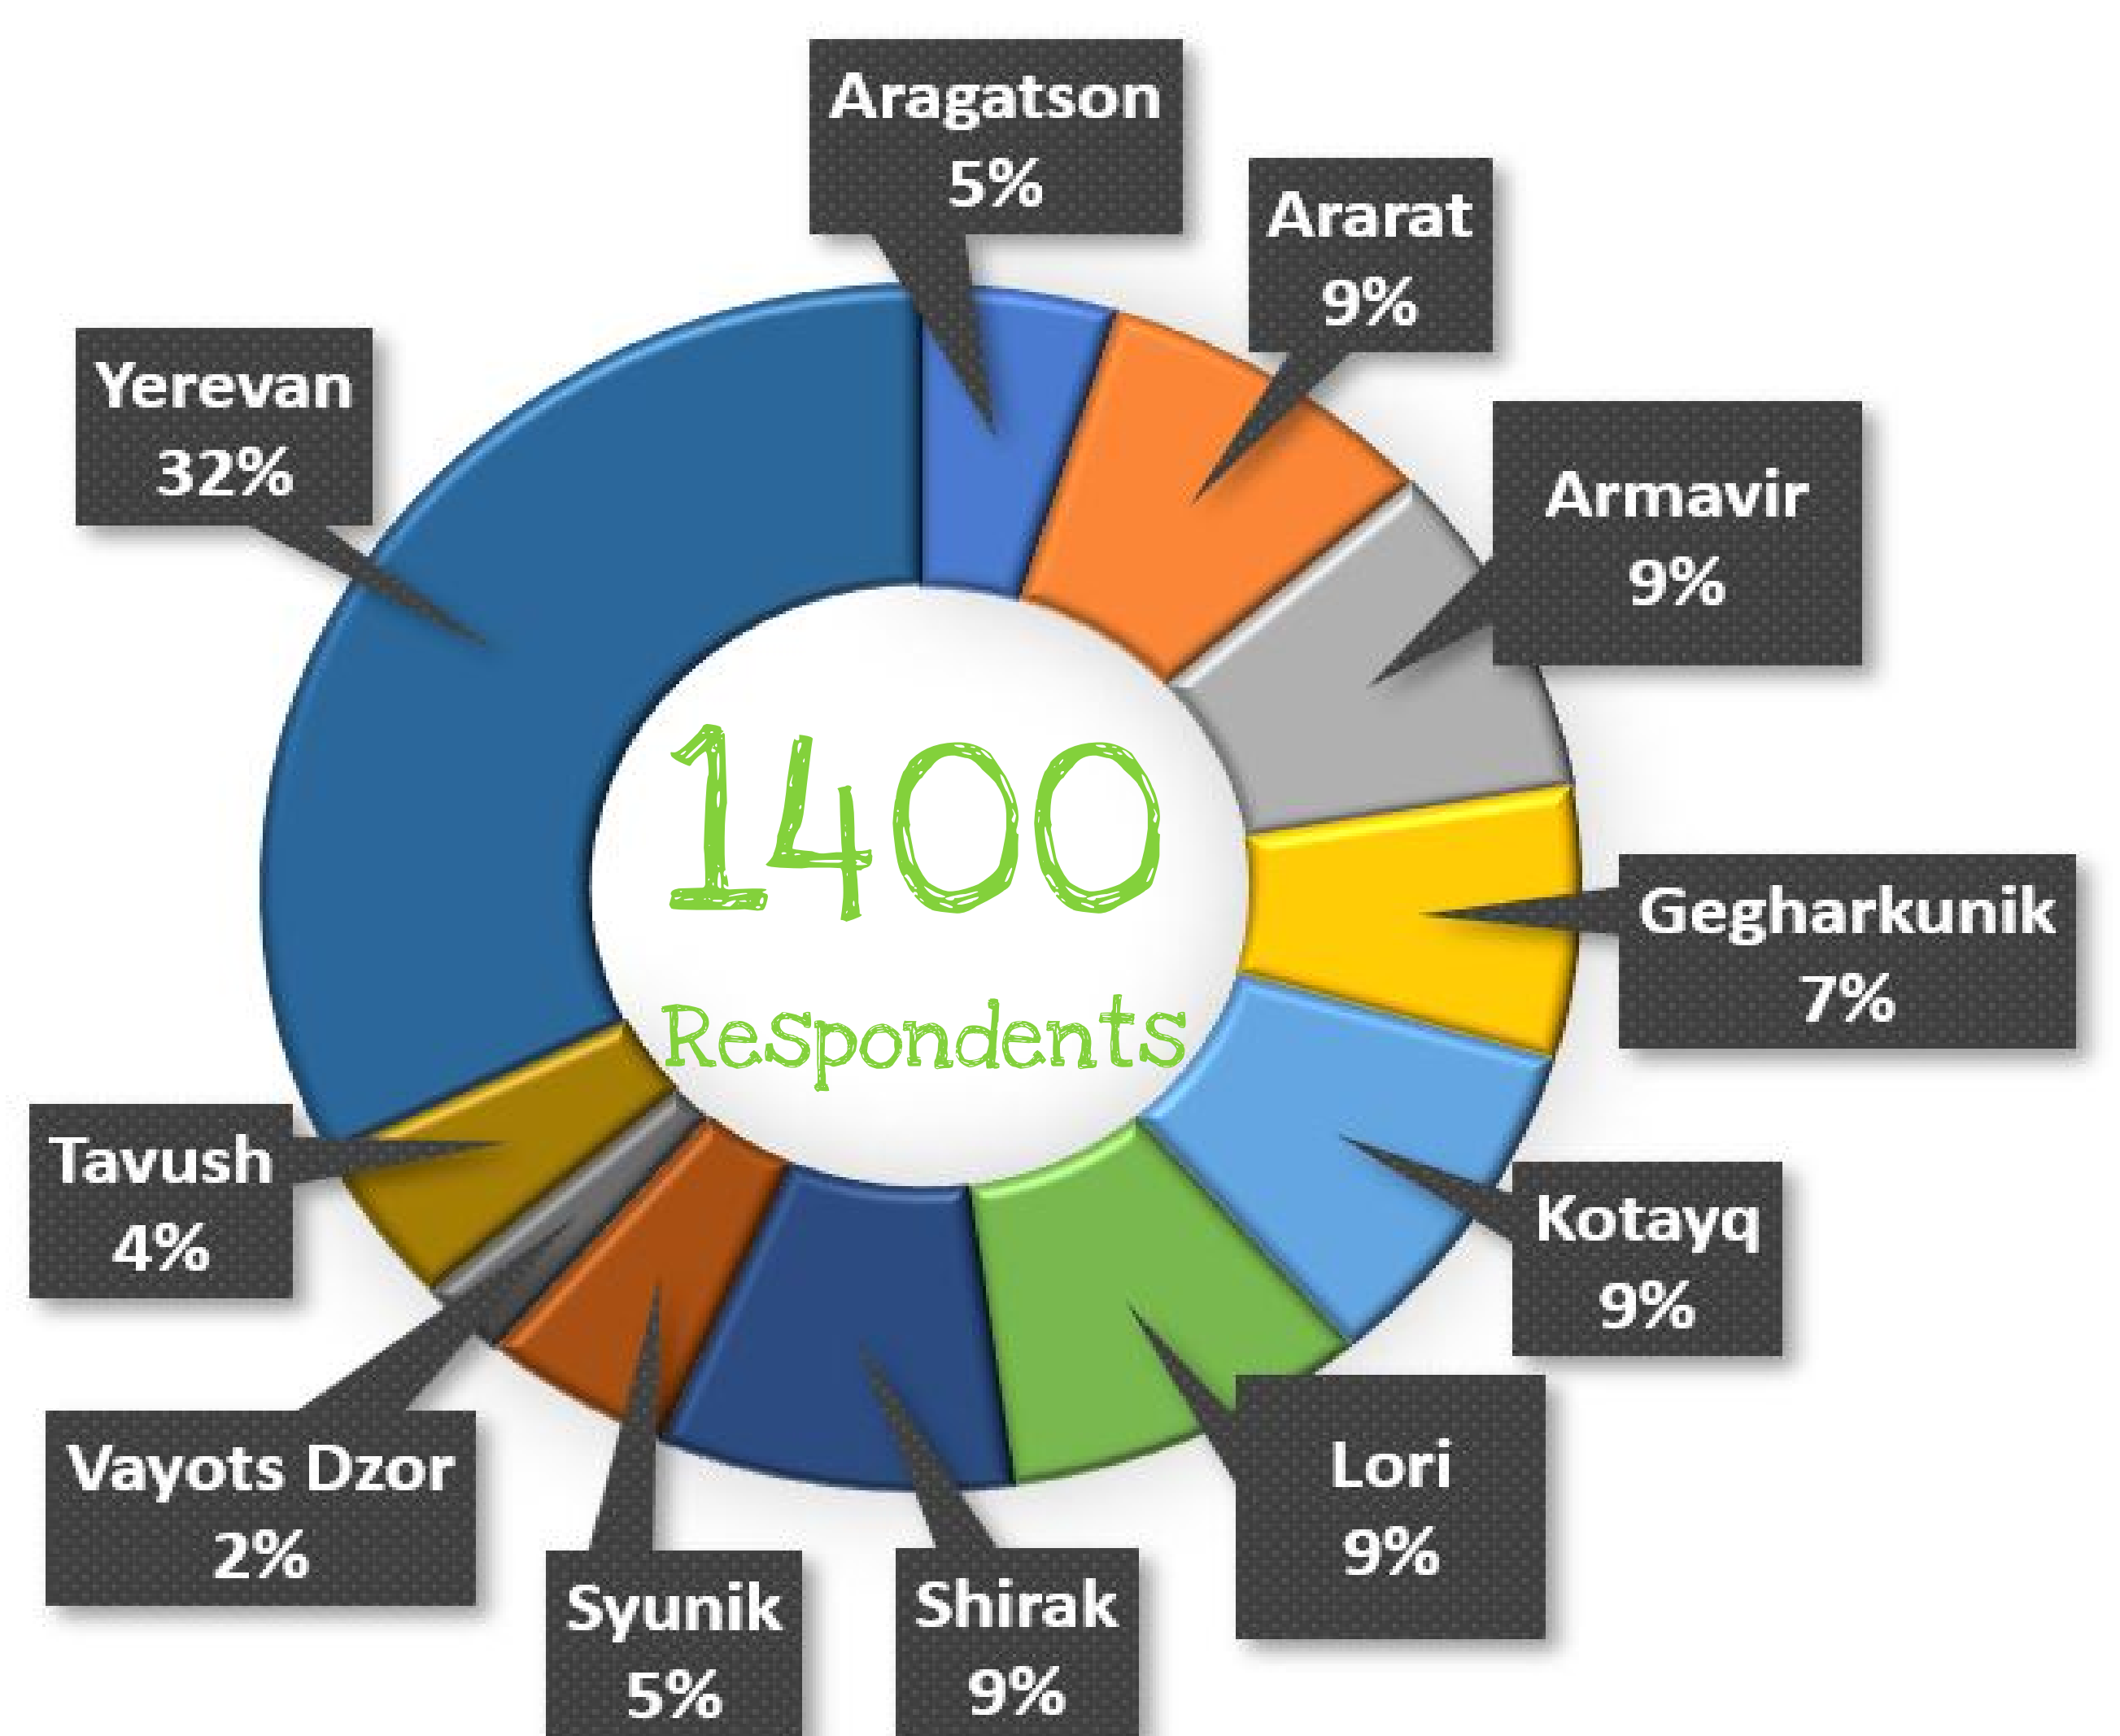

Pesticides banned in the EU are still available and used in Armenia.

In fact, for example, honeybees are treated with antibiotics and pesticides even by small beekeepers in remote areas of Armenia; the same for other products.

KAP survey 2019

The environmental Knowledge-Attitude-Practice (KAP) survey was commissioned by the ECOserve Environmental Programme under the guidance of the RA Ministry of Environment and implemented by Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) GmbH. The survey was implemented by ACT Assist GmbH in 2019.
